                                                                                                                                                                                                                                                                                                                                                                                                                                      This protein produced by recombinant expression of genomic DNA isolated from human prostate cancer PC-3 cells interacts with the response elements and network of receptors in the thyroid hormone/retinoic acid receptor subfamily. The products can be used in detection, diagnosis and in screening assays for subsenances which interact with UNRPs for use in diagnosis, drug design and therapeutic applications

Steroid receptor NER (AAR97982) is a novel member of the nuclear receptor family. Its amino acid sequence was deduced from a gene (AAT18996) isolated from a human osteosarcoma SAOS-2/B10 cell library. A COS stable expression system allows prodn. of recombinant NER. NER is useful for identifying cpds. which act e.g. as potentiators of NGF, muscarinic agonists or dopamine D1 antagonists. TOFA (5-tetradecyloxy)-2-furan carboxylic acid) was found to activate NER and to be a potent potentiator

G-protein coupled receptors. It was identified as the product of a DNA clone (AAT30031) isolated from an osteosarcoma SAOS-2/B10 library. Recombinant NER can be obtd. using a COS expression system. Cpds. that activate the NER receptor, such as TOFA (5-(tetradecyloxy)-2-furan carboxylic acid), potentiate the effects of nerve growth factor and may be useful in treatment of Alzheimer disease. They may also potentiate the effects of muscarinic agonists in the treatment of ocular hypertension, or dopamine bliopamine D1 antagonists in the treatment of psychoses and movement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    121 AGCCAGGGCTCCGGGGAAGGCGAGGGTGTCCAGCTAACAGCGGCTCAAGAACTAATGATC 180

                                                                                                  셤
                                                                                                                                                    ઠે
                                                                               ò
                                                                                  The invention describes a new targeting construct (I) comprising a first polynucleotide sequence homologous to a LX receptor beta (LXRB) gene, a second polynuclectide sequence homologous to the LXRB gene and a selectable marker. (I) is useful for producing transgenic animals, preferably mice having a disruption in the LXRB gene, that may be used as models for disease, e.g. diabetes. The transgenic animals methods are useful in identifying agents that modulate LXRB function used for disquosing, treating or ameliorating conditions associated with LXRB function, e.g. impaired glucose tolerance, reduced blood insulin levels, hypoactivity or lethargy. This is the amino acid sequence of the human LX receptor beta (LXRB), an RXR (retinoid X receptor) interacting protein
                                                                                                                                                                                                                                                                                                                                                                                             208

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a crystalline form comprising substantially pure liver X receptor (LXR) ligand binding domain polypeptide, ligand, and/or coactivator polypeptide. The crystalline LXR is useful for dealgaing modulator that selectively modulates the activity of a NR polypeptide compared to other polypeptides. Crystalline LXR is useful for screening several compounds for a modulator of a NR ligand binding domain polypeptide. The test sample is bound substrate. The test sample is synthesised directly on substrate. The coregulator comprises SRCI polypeptide. The present sequence represents the amino acid sequence of human liver X receptor LXR beta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Crystalline form useful for designing modulator that modulates activity of nuclear receptor polypeptide, comprising substantially pure liver X receptor ligand binding domain polypeptide, ligand, and/or coactivator polypeptide.

This invention relates to a novel method of determining whether a patient has an increased risk for developing a disease or disorder which comprises determining the presence of a mutation or polymorphism in the patient. See the patient or measuring the patient or in a cell of the patient. The invention may colypeptide in the patient or in a cell of the patient. The invention may be useful for the development of compounds with an antibacterial, antithyroid, cardiovascular-Gen, cytostatic, dermatological, eatingmanisoraters-Gen, gastrointestinal-Gen, gynaecological, hepatotrophic, insorders-Gen, gastrointestinal-Gen, gynaecological, hepatotrophic, immunosuppressive, muscular-Gen, nephrotrophic, osteopathic or virucide activity. The method is useful for determining whether a patient has an increased risk for developing a disease or disorder. The nucleic acid cencoding a nuclear receptor polypeptide, an expression vector comprising the nuclear acid operably linked to a promoter, or a compound that the muclear acid operably linked to a promoter, or a compound that condulates the biological activity of a nuclear receptor polypeptide, is useful for treating or preventing a disease or disorder of the adrenal gland, colon, cardiovascular, intestine, kidney, liver, lung, muscular, cy vary, blood, prostate, skin, spleen, stomach, testes, thymus, thyroid, uterus, pancreas, bone and joints, breast, or immune system, or metabolic or nutritive disease or disorder. The present sequence is that of a nuclear receptor protein which may be used in the method of the
                                                                                                                                                                                                                                                                                   Determining an increased risk for e.g. colon, brain or breast disease or disorder, by detecting a mutation or polymorphism in the nuclear receptor gene, or measuring expression or biological activity level of the nuclear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GINGIJSErSerSerSerAlaSerGlyProGJyAlaSerProGJyGJySerGlwAlaGJy

The invention relates to a crystal comprising at least 150 amino acid residues of the liver X receptor beta (LKRbeta) ligand binding domain. The ligand binding domain preferably comprises amino acid residues Ser242. Phe268, Phe214, Thr272, Leu274, Ala275, Ser278, Ile309, Met312, Leu313, Glu315, Thr316, Arg319, Ile327, Phe329, Leu330, Tyr335, Phe340, Leu449, Leu453, Trp457, according to the co-ordinate tables or homologue of the molecule or molecular complex, where the homologue has a root mean square deviation form the backbone atoms of the amino acids of not more square deviation form the backbone atoms of the amino acids of not more of the amino acid 220-461 of the 461 LKRbeta protein. The crystal is useful in X-ray crystallography, and for drug screening assays. This sequence corresponds to the full length human LXRbeta protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    208
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180

The method involves contacting a test substance with a cell transformed by an expression vector encoding an LXR transcription coupling factor capable of controlling ABCAl expression, and analyzing the effect of test substance on change in liver X receptor dependent transcriptional activity. The method of the invention is useful for screening a drug for improving lipid metabolism or insulin resistance. The present amino acid sequence represents a human LXR

In various cancer cells a variant ECDN protein, designated ECDN small mol. (ECDNsm) protein, is expressed.

Therefore screening for ECDN and ECDNsm protein binding mols., using recombinant ECDN and ECDNsm proteins will be useful in the identification of candidate anticancer drugs. Gene expression of ECDN and ECDNsm proteins in normal and cancerous tissues can be studied using primers and probes derived from ECDN and ECDNsm protein cDNA. Antibodies which

                                                                                                                                                                                                                                                                                                                    The invention relates to a combination comprising CDNAs that are differentially expressed in response to steroid treatment. Also included are the following: a high throughput method for using a CDNA to detect differential expression of nucleic acids in a sample; and a high throughput method of screening molecules or compounds to identify a ligand that specifically binds a CDNA. The sample is from a subject with the wilson disease and comparison of a standard defines a stage of that disease. The high throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA comprises: combining the combination with molecules or compounds under conditions to allow the combination with molecules or compounds under conditions to allow compensions. The combination is useful for preparing a composition for treating liver disorders associated with steroid therapy, e.g., cirrhosis or hepstitis. The present sequence represents a human protein which is differentially expressed in steroid-induced C3A liver cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     227
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            247
                                                                                                                                                                                                                                                                                                                                                                           AAW25034 shows the amino acid sequence of a human ubiquitous nuclear receptor polypeptide (UR). The UR is useful in assays designed to select substances which interact with the UR which may potentially be of use therapeutically. UR is also used in diagnosis and drug design. (ECDNsm) protein. ECDNsm protein is expressed in various cancer cells, therefore screening for ECDNsm protein binding mols., using recombinant ECDNsm proteins will be useful in the identification of candidate anticancer drugs. Gene expression of ECDNsm proteins in cancerous tissues can be studied using primers and probes derived from

The method comprises administering a LXR soonist. Or its pharmaceutical salt, solvate, or physiologically functional derivative. The LXR agonist is a compound of formula (I) or (II), as defined in the specification. The LXR agonist is defined as any compound that enhances the biological activity of LXRalpha and/or LXRbeta. LXRalpha and LXRbeta (collectively known as LXR) are nuclear hormone receptors that regulate the metabolism of lipids such as cholesterol. The LXR agonists are useful in a pharmaceutical composition for preventing and/or treating inflammatory bowel disease, such as Crohn's disease, ulcerative collitis, and inflammatory collitis caused by bacteria, ischemia, radiation, drugs or chemical substances. mellitus, dyslipidemia or atherosclerosis,

invention relates to N-substituted pyridone compounds of Disclosure; Page 517-519; 544pp; English. $\mathbb{E} \times \mathbb{E} \times$

The invention Frances to Arsubstituted Compounds to a pretitured formula. The compounds act as modulators of nuclear receptor, orphan nuclear receptors and liver X receptor (LXRalpha or LXRbeta). They are useful for the treatment, prevention or ameliotration of symptoms of conclear receptor mediated diseases or disorders which are modulated or affected by nuclear receptor activity or in which nuclear receptor activity is implicated e.g. hypercholesterolemia, hyperlipoproteinemia, hypertriglyceridemia, lipodystrophy, hyperglycemia, disbetes mallitus, dyslipidemia, atherosclerosis, gallstone disease, acne vulgaris, conditions with conditions, diabetes, parkinson's disease, acneer, inflammation, immunological disorders, lipid disorders, obesity, conditions characterized by a perturbed epidermal barrier contitions characterized by a perturbed epidermal barrier contitions characterized by cholesterol, triglyceride or bile of a disease or disorder affected by cholesterol, triglyceride or bile contitions of hyspocholesterolemia and in vitro method for altering nuclear receptor activity. The compounds are also used to reduce cholesterol levels, modulates cholesterol metabolism, increase concentrate (ABC1) in the cells. The compounds are also useful for the treatment of macrovascular disease, connary contexpendised. Hypothyroidism, renal failure. The present sequence represents con human LXR beta polypeptide

can bumman LXR beta polypeptide

Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

- Please note that the curators of the UniProt database have purged some temporary accession numbers from the most recent version of UniProt. These sequences have been assigned new permanent accession numbers. The new UniProt record may not contain the previous temporary accession number.
- If you encounter an accession number from an older search run against UniProt (results file extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or members of the public who may encounter UniProt temporary accession numbers.

Biol. Chem. 278:38821-38828 (2003).

C. -I FUNCTION: Orphan receptor. Binds preferentially to double-stranded of oligonucleotide direct repeats having the consensus half-site of sequence 5.-AGGTGA.3 and 4-nt spacing (DR-4).

C. -SUBUNIT: Forms a heterodimer with RXR.

C. -SUBCELIGLAR LOCATION: Unclear (Potential).

C. -TISSUE SPECIFICITY: Ubiquitous.

C. -SIMILARITY: Belongs to the nuclear hormone receptor family. NRI

C. -SIMILARITY: Contains 1 nuclear receptor DNA-binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This Swiss-Prot entry is copyright. 1. SUBCELLULAR LOCATION: Nuclear (By similarity).

1. SINGELLULAR LOCATION: Nuclear (By similarity).

2. SINGLARITY: Belongs to the muclear hormone receptor family.

Oxysterols receptor LixP-beta (Liver X receptor beta) (Nuclear orphan receptor LixP-beta) (Ubiquitously-expressed nuclear receptor) (UR)
Name=Nrlh2; Synonyms=Lxxb;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDITINE 55062154; PubMed=1971966; Song C., Kokontis J.M., Hitpakka R.A., Liao S.; Song C., Kokontis J.M., Hitpakka R.A., Liao S.; Fubiquitous receptor: a receptor that modulates gene activation by retinoic acid and thyroid hormone receptors."; Proc. Natl. Acad. Sci. U.S.A. 91:10809-10813(1994).
-!- FUNCTION: Orphan receptor. Binds preferentially to double-strand oligonucleotide direct repeats having the consensus half-site sequence 5'-AGGTCA-3' and 4-nt spacing (DR-4).
-!- SUBUNIT: Forms a heterodimer with RXR.
-!- SUBUNIT: Belongs to the nuclear hormone receptor family. NRI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        STRAIN=Spraque-Dawley, TISSUE-Liver;

Natl. Acad. Sci. Us.A. 99:16899-16903(2002).
-!-FUNCTION: Orphan receptor. Binds preferentially to double-stran oligonucleotide direct repeats having the consensus half-site sequence 5'-AGGTCA-3' and 4-nt spacing (DR-4).
-!-SUBGNIT: Forms a heterodimer with RXR.
-!-SUBCELIDIAR LOCATION: Nuclear (Potential).
-!-TISSUS SPECIFICITY: Ubiquitous.
-!-SIMILARITY: Belongs to the nuclear hormone receptor family. NR1
